Introduction

The neck, or cervical spine, is comprised of seven vertebral bones each of which includes a central opening thru which the spinal cord traverses. An intricate assembly of muscles, tendons, ligaments, nerves, and blood vessels surrounds the cervical column. The unique architecture of the neck affords it both strength and an extensive range of motion.

Injuries to the neck can result from a host of activities, which cause muscular, nerve, blood vessel or bone damage. These injures can occur from activities as simple as sleeping improperly, but can also occur by moving heavy loads or blunt force trauma. The terrestrial approach to these patients involves obtaining a detailed medical history and performing a thorough physical exam. These two components will help determine the need for and the type of diagnostic imaging, and initial therapy for the patient. The clinical outcome is dependent upon the forces involved and the pathology that occurred. Mild neck injuries such as ligamentous sprains or muscle strains can be treated conservatively with minimal to no residual impact; however, moderate to severe injuries may include fractures or herniated discs. These conditions produce greater amounts of pain and are associated with reduced range of motion, possible radiculopathy, and an overall longer duration of functional impairment. Severe neck injuries, of any origin, require immediate immobilization of the cervical spine and urgent evaluation by a physician.

Clinical Priority and Clinical Priority Rationale by Design Reference Mission

One of the inherent properties of space flight is a limitation in available mass, power, and volume within the space craft. These limitations mandate prioritization of what medical equipment and consumables are manifested for the flight, and which medical conditions would be addressed. Therefore, clinical priorities have been assigned to describe which medical conditions will be allocated resources for diagnosis and treatment. "Shall" conditions are those for which diagnostic and treatment capability must be provided, due to a high likelihood of their occurrence and severe consequence if the condition were to occur and no treatment was available. "Should" conditions are

those for which diagnostic and treatment capability should be provided if mass/power/volume limitations allow. Conditions were designated as “Not Addressed” if no specific diagnostic and/or treatment capability are expected to be manifested, either due to a very low likelihood of occurrence or other limitations (for example, in medical training, hardware, or consumables) that would preclude treatment. Design Reference Missions (DRMs) are proposed future missions designated by a set of assumptions that encompass parameters such as destination, length of mission, number of crewmembers, number of Extravehicular Activities (EVAs), and anticipated level of care. The clinical priorities for all medical conditions on the Exploration Medical Condition List (EMCL) can be found here (https://humanresearchwiki.jsc.nasa.gov/index.php?title=Category>All_DRM). The EMCL document may be accessed here (https://humanresearchwiki.jsc.nasa.gov/images/6/62/EMCL_RevC_2013.pdf).

Design Reference Mission	Clinical Priority	Clinical Priority Rationale
<p>Lunar sortie mission</p> <p>Assumptions:</p> <ul style="list-style-type: none"> ■ 4 crewmembers (3 males, 1 female) ■ 14 days total ■ 4 EVAs/crewmember ■ <u>Level of Care 3</u> 	Shall	<p>Neck injury can encompass a wide range of possible scenarios from muscle strain to spinal cord injury. Most cases are expected to be minor; however, even the minor injuries usually involve pain and functional impairment. While not all available terrestrial treatment modalities will be feasible during space flight, alleviation of pain with analgesics should be provided.</p>
<p>Lunar outpost mission</p> <p>Assumptions:</p> <ul style="list-style-type: none"> ■ 4 crewmembers (3 males, 1 female) ■ 180 days total ■ 90 EVAs/crewmember ■ <u>Level of Care 4</u> 	Shall	<p>Neck injury can encompass a wide range of possible scenarios from muscle strain to spinal cord injury. Most cases are expected to be minor; however, even the minor injuries usually involve pain and functional impairment. While not all available terrestrial treatment modalities will be feasible during space flight, alleviation of pain with analgesics should be provided.</p>
<p>Near-Earth Asteroid (NEA) mission</p> <p>Assumptions:</p> <ul style="list-style-type: none"> ■ 3 crewmembers (2 males, 1 female) ■ 395 days total ■ 30 EVAs/crewmember ■ <u>Level of Care 5</u> 	Shall	<p>Neck injury can encompass a wide range of possible scenarios from muscle strain to spinal cord injury. Most cases are expected to be minor; however, even the minor injuries usually involve pain and functional impairment. While not all available terrestrial treatment modalities will be feasible during space flight, alleviation of pain with analgesics should be provided.</p>

Initial Treatment Steps During Space Flight

A link is provided to a prior version of the International Space Station (ISS) Medical Checklist, which outlines the initial diagnostic and treatment steps recommended during space flight for various conditions which may be encountered onboard the ISS. Further diagnostic and treatment procedures beyond the initial steps outlined in the Medical Checklist are then recommended by the ground-based Flight Surgeon, depending on the clinical scenario. Please note that this version does not represent current diagnostic or treatment capabilities available on the ISS. While more recent versions of this document are not accessible to the general public, the provided version of the checklist can still provide a general sense of how medical conditions are handled in the space flight environment. Medical Checklists will be developed for exploration missions at a later point in time.

Please note this file is over 20 megabytes (MB) in size, and may take a few minutes to fully download.

ISS Medical Checklist (http://www.nasa.gov/centers/johnson/pdf/163533main_ISS_Med_CL.pdf)

Capabilities Needed for Diagnosis

The following is a hypothetical list of capabilities that would be helpful in diagnosis. It does not necessarily represent the current capabilities available onboard current spacecraft or on the ISS, and may include capabilities that are not yet feasible in the space flight environment.

- Crew medical restraint system
- Vital signs measurement capability (blood pressure, pulse, respiratory rate, temperature, pulse oximetry, as required per the patient's clinical state)
- Imaging modality [such as a camera, ultrasound, Magnetic Resonance Imaging (MRI), Computed Tomography (CT)]

Capabilities Needed for Treatment

The following is a hypothetical list of capabilities that would be helpful in treatment. It does not necessarily represent the current capabilities available onboard current spacecraft or on the ISS, and may include capabilities that are not yet feasible in the space flight environment.

- Cervical(C)-collar/splint
- All Cotton Elastic (ACE™) wrap
- Tape
- Bandaging
- Medication delivery device (such as a Carpuject)
- Sharps container
- Skin cleanser [such as alcohol/Benzalkonium (BZK)/iodine]
- Analgesics (non-narcotic, narcotic, oral and injectable)

Associated Gap Reports

The NASA Human Research Program (HRP) identifies gaps in knowledge about the health risks associated with human space travel and the ability to mitigate such risks. The overall objective is to identify gaps critical to human space missions and close them through research and development. The gap reports that are applicable to this medical condition are listed below. A link to all of the HRP gaps can be found here (<http://humanresearchroadmap.nasa.gov/Gaps/>).

- 1.01 - We do not know which emerging technologies are suitable for preflight medical screening for exploration missions.
- 2.01 - We do not know the quantified health and mission outcomes due to medical events during exploration missions.
- 2.02 - We do not know how the inclusion of a physician crew medical officer quantitatively impacts clinical outcomes during exploration missions.
- 3.01 - We do not know the optimal training methods for in-flight medical conditions identified on the Exploration Medical Condition List taking into account the crew medical officer's clinical background. (Closed)
- 3.03 - We do not know which emerging technologies are suitable for in-flight screening, diagnosis, and treatment during exploration missions.
- 4.01 - We do not have the capability to provide a guided medical procedure system that integrates with the medical system during exploration missions.
- 4.02 - We do not have the capability to provide non-invasive medical imaging during exploration missions.
- 4.03 - Limited capability to treat back/neck pain and injuries in the space flight environment
- 4.04 - We do not have the capability to deliver supplemental oxygen to crew members while minimizing local and cabin oxygen build-up during exploration missions.
- 4.05 - We do not have the capability to measure laboratory analytes in a minimally invasive manner during exploration missions.
- 4.06 - We do not have the capability to stabilize bone fractures and accelerate fracture healing during exploration missions.
- 4.07 - Limited wound care capability to improve healing following wound closure (Closed)
- 4.08 - We do not have the capability to optimally treat musculoskeletal injuries during exploration missions.
- 4.09 - We do not have the capability to provide medical suction and fluid containment during exploration missions.
- 4.12 - We do not have the capability to generate and utilize sterile intravenous fluid from potable water during exploration missions.
- 4.14 - We do not have the capability to track medical inventory in a manner that integrates securely with the medical system during exploration missions.
- 4.15 - Lack of medication usage tracking system that includes automatic time stamping and crew identification
- 4.17 - We do not have the capability to package medications to preserve stability and shelf-life during exploration missions.
- 4.19 - We do not have the capability to monitor physiological parameters in a minimally invasive manner during exploration missions.
- 4.23 - We do not have the capability to auscultate, transmit, and record body sounds during exploration missions.
- 4.24 - Lack of knowledge regarding the treatment of conditions on the Space Medicine Exploration Medical Condition List in remote, resource poor environments (Closed)
- 5.01 - We do not have the capability to comprehensively manage medical data during exploration missions.
